

Bug Report: OrangeHRM Open Source Testing Project

Prepared By: Ali Mohamed
Role: Software Quality Assurance Engineer
Date: June 2026

Reference: Findings logged during execution of TC_001 - TC_049 (OrangeHRM Open Source Testing Project test suite)

Bug ID	Title	Module	Severity	Priority	Environment	Preconditions	Steps to Reproduce	Actual Result	Expected Result	Status
BUG_001	Reset Password fails with a 504 Gateway Time-out when a valid username is submitted	Authentication - Reset Password	Critical	Highest	Chrome, OrangeHRM Demo Environment	User is on the login page and has access to a valid system username (Admin).	1- open the browser 2- go to OrangeHRM.com 3- tap on Forget password link 4- write a valid username (e.g Admin) 5- press on reset password button	Page does not load, browser shows "504 Gateway Time-out" and the request is never completed. Reproduced consistently across TC_010, TC_013 and TC_016, including when only checking for the confirmation message.	A confirmation message should be displayed and a password reset link should be sent to the user's email.	Open
BUG_002	Forgot Password flow returns a "success" message for usernames that don't exist in the system	Authentication - Reset Password	High (Security - Information Disclosure)	High	Chrome, OrangeHRM Demo Environment	User is on the Forget Password page. No valid account is needed for this scenario.	1- open the browser 2- go to OrangeHRM.com 3- tap on Forget password link 4- write a username that does not exist (e.g Ali) 5- press on reset password button	System responds with "Reset Password link sent successfully - a reset password link has been sent to you via email" for a username that was never valid. Reproduced in both TC_011 and TC_014, so this isn't a one-off.	An invalid or non-existing username should be rejected with an error, not treated the same as a valid one - otherwise the response itself becomes a way to test which usernames are real.	Open

Testing Notes

Both defects above sit in the same area of the system - the password reset flow reachable from the login page. They were caught while running TC_008 through TC_016, where the reset request either crashed outright or gave a misleading success response. Everything else exercised in this round (Login validation, Dashboard, sidebar navigation, PIM employee add/edit/delete/search, and Admin user management covered by TC_001-TC_009 and TC_017-TC_049) passed as expected with no discrepancies between expected and actual results, so no defects are being reported against those areas at this time. Modules not yet covered by the test suite, such as Leave Approve/Reject, Recruitment, and Logout, are recommended for a follow-up testing pass.
